Logic Assignment: Go to google.com

1. Identify the problem:

First, I need to go to Google.com, and ensure I am connected to the internet and know why I am going there (e.g., for a search, to gather information, or for another task).

2. What do I need to know to answer the question:

What: What is the purpose of going to Google.com? Is it to search for something specific or just to open the website?

Where: Where will I access the website from? That is, from my computer, phone, or any other device?

When: When must this task be completed? Is there any time pressure?

How: With the use of Chrome, Safari, etc., how would I access google.com?

3. Identify all the data I need to collect:

Purpose: The goal here is to confirm whether I'm looking for something or just opening Google.com.

Device: I will be using my laptop with an internet connection.

Time: This task can be done right now since I am online.

4. Organize the data:

Purpose: I want to open Google.com to do a search.

Device: I will use my laptop browser, Google Chrome.

Time: I have the internet at this time and can work on this anytime.

5. Find and identify the relationship:

Purpose and device: The reason I'm going to google.com determines what I do next. Since I want to perform a search, I need to access it through a browser.

Time and access: I can complete this task immediately, using the internet on my laptop.

6. To find a solution:

Open Google Chrome on my laptop.

Type "google.com" into the address bar and press Enter.

Once on the site, I can perform the search or complete the task I need.

7. Presentation (tell a story):

I'll use my laptop to open Google Chrome and go to Google.com by typing the URL in the address bar. Once there, I can search for what I need or complete any other task required. This simple process ensures I access the site efficiently. In the future, I can use the same steps whenever I need to visit Google.com.
